

Minneapolis–St. Paul International Airport Carbon Policy Statement

The Metropolitan Airports Commission (MAC) takes its role as an environmental steward seriously, and as an invested member of the global community, we recognize the importance of both reducing and managing the environmental impacts from the Minneapolis-St. Paul International Airport (MSP). Responsible carbon management using cost-effective strategies that target the efficient use of electricity, natural gas, and other fossil fuels is a critical component of our efforts.

Through its sustainability efforts, the MAC will implement strategies that target year-over-year carbon emission reductions. This will be achieved by continuing our long-standing commitment to energy efficiency and operational enhancements that reduce our carbon footprint while still providing cost-effective, safe, and efficient air service that is a hallmark of MSP.

We look forward to pursuing opportunities that further decrease our carbon emissions while increasing air transportation services as we provide your best airport experience!
